To Whom It May Concern:

This letter is to confirm that Sentry Metrics is actively engaged to assist Aegisys with an ongoing information security assessment program. The program includes the assessment of various operational and control objectives on an annual basis, interviews with key staff members to ensure their understanding of current policies and procedures, and also requires that all Internet-facing devices on the Aegisys network be tested from an external perspective to ensure there are no significant security exposures.

Based on the most recent assessment performed in December 2009, we identified very few issues that need to be addressed, and none that would be classified as significant. Overall the controls that are in place today provide a level of security beyond that typically seen in an organization of this size. In addition, we have performed a vulnerability assessment of the internal systems, reviewed the firewall rules set and reviewed the overall network architecture. We believe that the identified safeguards and controls provide Aegisys, its systems, and the data contained therein, with an adequate level of protection.

Sincerely,

Dave Millier, CISSP
CEO
